EXPERIENCE

HashTek Inc. | *Sr. Full Stack Developer* *Feb 2024 - Present*

- Owned the **patient-onboarding roadmap and activation objective** for a healthcare platform serving **50,000+ users**; aligned engineering and design on launch criteria and increased seven-day activation from **58% to 72%**.
- Combined **15 user interviews**, support-ticket themes, and SQL funnel analysis to identify verification drop-offs; translated findings into product requirements for clearer instructions, saved progress, and recovery from failed submissions.
- Translated the activation objective into an **eight-week roadmap**, prioritizing **50+ requests** by user reach, severity, effort, and dependencies; set milestones and release scope with the cross-functional team.
- Benchmarked **five competing patient portals** across registration, verification, and recovery using public demos and reviews; presented findings that secured leadership approval to prioritize saved progress over dashboard customization.
- Resolved a launch-scope disagreement in a **12-person team** using drop-off data and effort estimates; won agreement to fix verification timeouts and defer dashboard customization.
- Automated regression checks and release readiness with QA and DevOps, cutting **median deployment time from 25 to 15 minutes** across 20 releases and simplifying rollback for failed launches.
- Used retrospectives to clarify acceptance criteria and assign blocker owners; average completed story points rose from **40 to 50 per sprint** across six-sprint periods with consistent staffing and estimation.
- Presented weekly milestones, risks, and post-launch findings to engineering and business leaders; secured approval for follow-up onboarding improvements by connecting user feedback with activation data.

Capgemini, India | *Product Engineer (Full Stack .NET)* *May 2021 - Apr 2022*

- Translated business workflows into user stories and acceptance criteria for enterprise .NET features, partnering with product owners and QA to resolve ambiguous rules before development.
- Investigated retrieval bottlenecks with SQL and redesigned queries and indexes, reducing **p95 response time from 400 to 260 ms** under comparable load and accelerating routine record lookup.
- Coordinated release packaging and validation with QA and DevOps; cut **median release execution from 60 to 30 minutes** across 12 deployments through repeatable automation.
- Led stakeholder demos and user acceptance reviews, converting feedback into prioritized fixes and securing business sign-off before release.

SELECTED PRODUCT & AI PROJECTS

AI Product Feedback Assistant | Personal Project

- Redesigned feedback review with an AI assistant that grouped comments into product opportunities; reduced **median end-to-end review time from 30 to 12 minutes**, including human checks, across 20 paired batches.
- Evaluated theme classification on **200 held-out comments**, reaching **92% agreement** with manual labels; reviewed errors by customer segment and documented failure cases to guide human review.
- Redacted identifiers and required source-linked summaries and human approval; compared prompt and retrieval configurations, versioned evaluation results, and checked for unsupported claims and accuracy regressions after updates.

Network Configuration and Recovery Toolkit | Personal Project

- Built Python/Ansible backups and configuration-drift checks with GitLab CI; deployed Prometheus/Grafana dashboards using SNMP metrics and syslog correlation for interface errors and BGP session health.
- Implemented approved recovery actions, bounded retries, dry runs, and rollback; cut **median alert-to-recovery time from 8 to 3 minutes** across 20 paired trials, backed by **30 pytest cases**.

Network Incident Triage Assistant | Personal Project

- Built an LLM assistant grounded in sanitized syslog, topology data, and runbooks; reduced **median triage-draft time from 10 to 6 minutes** across 20 held-out cases.
- Assessed disclosure and hallucination risks; used identifier redaction, vendor-balanced tests, and human approval. Versioned prompts and evaluated model updates against verified diagnoses to detect unsupported recommendations.

SKILLS

Product: User research, PRDs, prioritization, roadmaps, success metrics, experimentation, stakeholder alignment
Analytics and delivery: SQL, Python, Excel, Google Sheets, .NET, GitLab CI/CD
AI systems: Prompt/context engineering, retrieval grounding, model evaluation, AI risk assessment, privacy and bias checks

EDUCATION

University of North Texas | M.S. in Business Analytics *Dec 2023*
Vellore Institute of Technology | Integrated M.S. in Software Engineering *Jul 2020*
